

Geometric Series up to n

$$S_n = \sum_{i=0}^{n-1} a^i x$$

$$S_n = a^0 x + a^1 x + a^2 x + \dots + a^{n-1} x$$

$$aS_n = a^1 x + a^2 x + a^3 x + \dots + a^n x$$

$$S_n - aS_n = x - a^n x$$

$$S_n - aS_n = x(1 - a^n)$$

$$S_n(1 - a) = x(1 - a^n)$$

$$S_n = x \frac{(1 - a^n)}{1 - a}$$

Geometric series up to ∞ Using the proof for S_n we can calculate the limit of S when n approaches ∞

If $a < 1$ then the limit converges and we can find a definite value. Otherwise the limit diverges to negative infinity

$$\lim_{n \rightarrow \infty} x \frac{1 - a^n}{1 - a} = \frac{x}{1 - a}, \quad a < 1$$

$$\lim_{n \rightarrow \infty} x \frac{1 - a^n}{1 - a} = 0 \quad a = 1$$

$$\lim_{n \rightarrow \infty} x \frac{1 - a^n}{1 - a} = \infty, \quad a > 1$$
